

Overlap types

Defining feature-overlaps between sequences

Sequence-position definitions

- Reference Sequence

- Rs is the **s**tarting location/position of a *feature* within the Reference
- Re is the **e**nding location of a *feature* within the reference
- For the purposes of this exercise (case where Rs-Re is an intron) Re is always greater in number than Rs and location number on the sequence increases from left to right

- Variant (mutant) sequence

- Ms is the starting location of a *feature* within the Variant
- Me is the ending location of a *feature* within the reference
- When Ms has a higher value than Me it defines an *insertion* and $Ms = Me + 1$ (always)

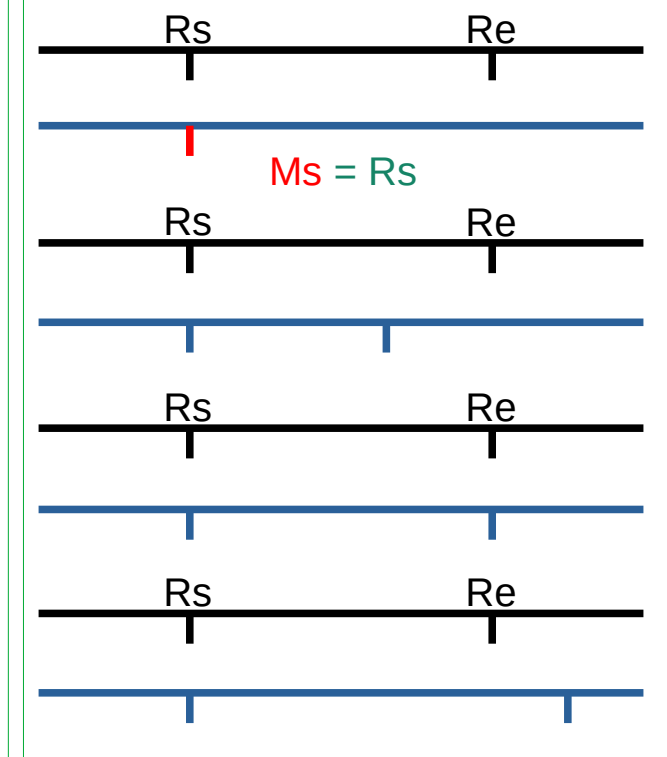

When **Ms** = **Me**, colour shown as purple

Overlap definitions

- The first iteration of this analysis (different number-set) was not systematic, missing cases where $M_s = M_e$.
- Second iteration considered only definitions where $R_e > R_s$
 - Simply because the main case I am interested in is where the range $R_e \dots R_s$ is an intron range. This is called “skip” or “gap” in the code, to more generically describe the feature
 - The diagrams did not show a distinction in colour between M_s and M_e
- Third iteration shows a distinction in colour between M_s & M_e in diagrams
 - It thereby expands the number of cases to include where $M_s = M_e + 1$
 - Specifically the second-iteration cases 2, 3, 13, 16, 18 have another type
 - The other second-iteration cases do not have another type because these are clearly separated by > 1 given their relationships to R_e & R_s
 - Eg: if one of the points R_e or R_s lie between M_s & M_e , then it is impossible for $M_s = M_e + 1$
- $R_e \dots R_s$ effectively becomes a mask on the variants that are to be included
- Where a deletion crosses the skip-boundary, it must be detected to retain the part of the deletion that lies outside the range.

Overlap types where $Re > Rs$ – second iteration

Numbering overlap types for second iteration

Numbering overlap types for second iteration

First iteration numbering

Numbering overlap types for third iteration

Second iteration numbering

FI: Overlap type 1

SI: OL 2; TI: ol2

- First iteration (FI) overlap definitions

FI: Overlap type 2

SI: OL 3; TI: OL 4

- Distal concatenation (Ref distal to Var)
 - $(Ms < Rs) \text{ AND } (Me = Rs) \text{ AND } (Re > Rs)$

FI: Overlap type 3

SI: Not defined

- Distal concatenation (Ref distal to Var)
 - $(Ms < Rs) \text{ AND } (Me = Rs) \text{ AND } (Re = Rs)$

- Should not occur when Ref feature is a skip ($Re > Rs$)

FI: Overlap type 4

SI: OL 6; TI: OL 8

- Reference entirely within variant
 - $(Ms < Rs) \text{ AND } (Me > Re)$

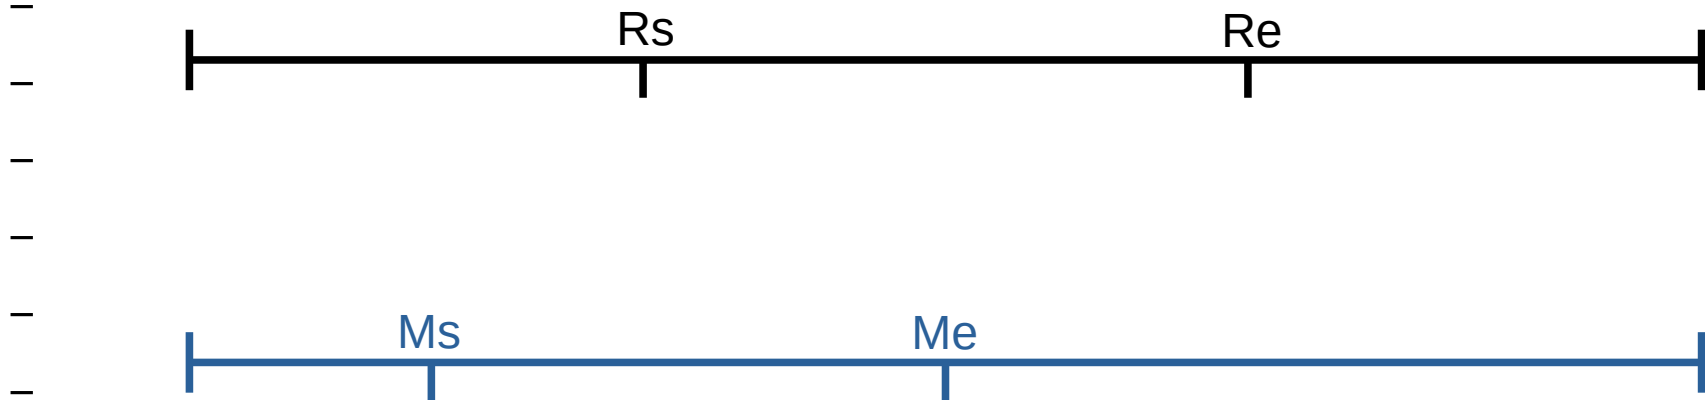

- $Re > Rs$ not tested, but should be true when Ref feature is a skip ($Re > Rs$)

FI: Overlap type 5

SI: OL 4; TI: OL 6

- Distal overlap (Ref distal to Var)

- $(Ms < Rs)$ AND $(Me < Re)$

- $Re > Rs$ not tested, but should be true when Ref feature is a skip ($Re > Rs$)

FI: Overlap type 6

SI: OL 5; TI: OL 7

- Distal overlap (Ref distal to Var)
 - $(Ms < Rs) \text{ AND } (Me = Re) \text{ AND } (Re > Rs)$

FI: Overlap type 1A

SI: OL 18; TI: OL 24

- No overlap
 - $(Ms > Rs) \text{ AND } (Re < Ms)$

- $Re > Rs$ not tested, but should be true when Ref feature is a skip ($Re > Rs$)

FI: Overlap type 7

SI: OL 16; TI: OL 21

- Proximal concat
 - $(Ms > Rs) \text{ AND } (Re = Ms) \text{ AND } (Me > Ms)$

- $Re > Rs$ not tested, but should be true when Ref feature is a skip ($Re > Rs$)

FI: Overlap type 8

SI: OL 15; TI: OL 20

- Proximal point
 - $(Ms > Rs) \text{ AND } (Re = Ms) \text{ AND } (Me = Ms)$

- $Re > Rs$ not tested, but should be true when Ref feature is a skip ($Re > Rs$)

FI: Overlap type 9

SI: OL 12; TI: OL 15

- The Variant range is entirely within the Reference region
 - $(Re > Ms)$ AND $(Me < Re)$

- $Re > Rs$ not tested, but should be true when Ref feature is a skip ($Re > Rs$)

FI: Overlap type 10

SI: OL 14; TI: OL 19

- Proximal overlap (Variant distal to ref)

– $(Re > Ms) \text{ AND } (Me > Re)$

– $Re > Rs$ not tested, but should be true when Ref feature is a skip ($Re > Rs$)

FI: Overlap type 11

SI: OL 13 ; TI: OL 17

- Variant within reference - distal
 - $(Re > Ms)$ AND $(Me = Re)$

FI: Overlap type 12

SI: Not defined

- Coinciding points on both
 - $(Rs = Ms)$ AND $(Ms = Re)$ AND $(Ms=Me)$

- Should not occur when Ref feature is a skip ($Re > Rs$)

FI: Overlap type 13

SI: OL 9; TI: OL 12

- Coincident feature positions
 - $(R_s = M_s) \text{ AND } (R_e = M_e)$

FI: Overlap type 14

SI: OL 10 ; TI: OL 13

- Coincident start, variant longer than ref
 - $(R_s = M_s)$ AND $(M_e > R_e)$

FI: Overlap type 15

SI: OL 8; TI: OL 10

- Coincident start, variant shorter than ref
 - $(R_s = M_s) \text{ AND } (M_e < R_e)$

FI: Type 9

SI: OL 12; TI: OL 15

- Type 9: The Variant range is entirely within the Reference region
